# Ultra Clean Needle Cleaning System

This system uses your high pressure water system (200-500 psi) to flush both needles and modules, leaving you with a clean and easily inspected brine head. By removing the modules from the head every time you clean the needles, you are ensuring that your brine head is clean as well. This will give you increased yields, repeatability, and more consistent piece-to-piece injection.

With this needle cleaning system, your needle handling is greatly reduced by eliminating individual needle handling. By handling the needles in modules, cleaning time is significantly reduced; freeing up personnel, and times are decreased from hours to minutes with the module system.

For more information, please contact your local JBT/CAT territory sales manager.
